

Then, go to “Advanced system settings”,

Under “Advanced” tab, click on “Environment Variables ...” button at the bottom.

Double click PATH and add new path into the “variable value”. Make sure you separate the value with “;”

Let's sum up what we just did

PATH is an environment variable that holds all the executable shell commands. When you type something in the command prompt, it will go through all the path and search for the match of the command line utility name you have just entered.

In short, there are tons other environment variables in Windows, if you are interested in how it works, you can go to [Technet documentation](https://technet.microsoft.com/en-us/library/bb790712.aspx) and check out.
